**Known issues with Myanmar font**

    1. Myanmar1 doesn't know how to join **ng** with **ka, kha, ga** and **gha**.

2) **ntva** is not displayed properly in Myanmar1. The subscript ta and va are on top of each other.

3) **khvaa**. The upsidedown J is the long "a" sign. The other form of the "**aa**" sign looks like a circle with the lower left part missing. Unicode represents them both as a single character "**aa**". It's up to the font to decide which one should be shown. Generally, tall characters get the upsidedown J form and normal height characters get the half circle form.

4) **kru**. - Much like the "**aa**" sign, "**u**" has short and tall forms and the font is responsible for deciding which one to use.
